Domination ： ノーズマスクピット（1. Ⅱ　2. Ⅲ）

Number ： ―

〔 Test content 　　 〕
　Pollen penetration test

〔 Test procedure 　 〕
　ボーケン法（JSIF A 030-2004）

　The article for examination was placed on a black filter paper in a glass filter set into a glass holder. 0.05g of cedar pollen was uniformly placed on the surface of the article. After aspiration with an aspiration pump at a flow of 12L/min for one minute, the filter paper was measured and the pollen penetration rate was calculated using the formula below. A digital photograph of the surface of the filter paper after aspiration is included.
$$\text{Pollen penetration rate (\%)} = \frac{\text{mass of the filter paper after penetration (g)} - \text{mass of the filter paper before penetration (g)}}{\text{mass of adherent pollen before aspiration (g)}} \times 100$$

〔 Test result 　　 〕

	object to be examined	Pollen penetration rate (%)
1	Nose Mask Pit	0.0
2	ノーズマスクピット Ⅲ	0.0

（ Note 　 ）
　・ The test above is specified by the client
